Module 2 Session 2

1.Install GCC on your computer and verify the installation by running gcc --version in your terminal or command prompt.

Windows

1. Download and install MinGW-w64 or TDM-GCC.
2. Add the GCC bin folder to the system PATH.
3. Open Command Prompt.
4. Run:

gcc --version

Output

gcc (MinGW-W64) 14.2.0

Copyright (C) Free Software Foundation, Inc.

2.Open DevC++ and create a new file named hello.c. Write a C program that prints 'Hello, Instagram World!' to the console.

```c
#include <stdio.h>

int main()
{
    printf("Hello, Instagram World!\n");
    return 0;
}
```

```
D:\26May_Mahek Bosami
Hello, Instagram World!

--------------------------------
Process exited after 0.131 seconds with return value 0
Press any key to continue . . .
```

Module 2 Session 2

3.Identify and label the header, main function, and return statement in your hello.c program using comments.

```
// Header File
#include <stdio.h>

// Main Function
int main()
{
    printf("Hello, Instagram World!\n");

    // Return Statement
    return 0;
}
```

Labels

- **Header File:** #include <stdio.h>
- **Main Function:** int main() { ... }
- **Return Statement:** return 0;

4.Compile your hello.c file using the GCC command line (gcc hello.c -o hello) and run the output file to display the message in your terminal.

1. Open **Command Prompt**.
2. Go to the folder where hello.c is saved using the cd command.
3. Compile the program using:

```
gcc hello.c -o hello
```

4. Run the program using:

```
hello.exe
```

5. The output will be:

```
Hello, Instagram World!
```

Example:

C:\Users\Student\Desktop>gcc hello.c -o hello

C:\Users\Student\Desktop>hello.exe

Hello, Instagram World!

This confirms that the hello.c program was compiled and executed successfully using GCC on Windows.
