

Practical 5 — Comparison of C and OOP

Aim

To compare the procedural C task list with the OOP TaskList implementation.

Comparison

C Version

1. Separate arrays are needed for task and status.
2. Data and functions are separate.
3. Managing and adding more features becomes difficult.

OOP Version

- Task class stores task and status together.
- Data and methods are grouped inside a class.
- Classes and methods make the program easier to organize and extend.
